Where each forecaster lands on each population, test windows (all 22 forecasters on the same windows). ankyra-lite is first on 9 of 9 populations; no other forecaster is in the top two on more than 3 of them. The position uses the mean per-unit rank, a secondary summary; the primary estimand is in figure 3. Rows: mean position over the populations. ankyra-lite: the released recipe R (carrier trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned; three seeds averaged; figure 1b). Linear-context: the TiDE implementation of the release, whose forecast is a linear map of the load context.
