Peak readout $U = \max_d (\hat{L}_d + A_{\tau_d})$: ankyra-lite's daily means plus the largest recent excursion of the same day type (the anchoring layer's readout). Unit-equal improvement in absolute peak error with 95% unit-and-month intervals. a, b: blue better, red worse, open or grey not resolved. c: against the same readout applied to each baseline's trajectory (the release rule), all 21 baselines (22 forecasters). Bold: the six release test populations (shaded). ankyra-lite: the released recipe R (carrier trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned; three seeds averaged; figure 1b).
