Error of the energy delivered through each forecast day, 22 forecasters on the same test windows. For each unit and day d, the RMS over the unit's windows of the error of the mean load over days 1..d, divided by the unit's mean load; curves are geometric means over one fixed set of units, the aggregation of figure 9 applied to energy. Day 31 is the monthly energy error of figure 11. Computed after scoring. ankyra-lite: the released recipe R (carrier trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned; three seeds averaged; figure 1b). Linear-context: the TiDE implementation of the release, whose forecast is a linear map of the load context.
