Where each forecaster lands on each population, test windows (all 22 forecasters on the same windows). ankyra-lite is first on 9 of 9 populations; no other forecaster is in the top two on more than 3 of them. The position uses the mean per-unit rank, a secondary summary; the primary estimand is in figure 3. Rows: mean position over the populations. ankyra-lite 0.2.0: carrier recipe Rw (trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned and each training window's loss weighted by the inverse-noise rule; six seeds averaged; figure 1b), the anchoring layer, the state rule and the origin-continuity layer; hourly errors score the delivered trajectory after that layer, energy, level and peak are read before it (readout rule A). Linear-context: the TiDE implementation of the release, whose forecast is a linear map of the load context.
