Block attribution on the test windows of the six release test populations. The three blocks are orthogonal (P1), so a forecast's hourly MSE is the sum of its level, daily-path and within-day MSE. a: the median over units of each block's share (medians of three shares need not add to 100). b, c: unit-equal RMS improvement of ankyra-lite in each block. Descriptive, computed after scoring. ankyra-lite 0.2.0: carrier recipe Rw (trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned and each training window's loss weighted by the inverse-noise rule; six seeds averaged; figure 1b), the anchoring layer, the state rule and the origin-continuity layer; hourly errors score the delivered trajectory after that layer, energy, level and peak are read before it (readout rule A).
