Loss by forecast day, 22 forecasters on the same test windows of the six release test populations. For each unit, the day's CV(RMSE) is the RMSE of that day's 24 hours over the unit's mean load; curves are geometric means over one fixed set of units (all daily errors nonzero), the scale of the primary estimand. Vertical lines: week boundaries. ankyra-lite 0.2.0: carrier recipe Rw (trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned and each training window's loss weighted by the inverse-noise rule; six seeds averaged; figure 1b), the anchoring layer, the state rule and the origin-continuity layer; hourly errors score the delivered trajectory after that layer, energy, level and peak are read before it (readout rule A). Linear-context: the TiDE implementation of the release, whose forecast is a linear map of the load context.
