ankyra-lite (the carrier of the released recipe R with three seeds averaged, anchored, weekly seasonal naive on state windows) against reduced and alternative versions of itself, hourly error on the test windows. Unit-equal improvement with 95% unit-and-month intervals; filled = interval excludes zero; positive = ankyra-lite is better. Shaded: the six release test populations. c: recipes F and V are those of figure 18; every other carrier and recipe is anchored by the same layer. d: ankyra-lite against the handover arms (the fixed division without any handover, a fixed half weight on the carrier's daily means, one weight per window instead of the weekly weights) and against one whole-window combination weight and the half-and-half average of the history side (fixed-division daily means plus the analog-day shape) and the carrier. e: ankyra-lite (red, weeks 1-4 light to dark, with intervals) and the fixed division (grey diamonds, point estimates; filled = resolved) against the carrier alone by forecast week. f: the mean handover weight on the carrier's daily means by week (½ = the prior without evidence).
