Rank tests on per-unit RMSE, test windows, 21 forecasters. a: mean ranks over the units of the six release test populations (Friedman test p < 1e-300); the shaded band is the Nemenyi critical difference from ankyra-lite's rank, and filled markers differ from ankyra-lite in a Holm-corrected Wilcoxon signed-rank test. b: the same paired test per population (bold: the six release test populations). Rank tests weight every unit equally and ignore the size of the differences; the primary estimand is the log RMS ratio of figure 3. ankyra-lite 0.2.0: carrier recipe Rw (trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned and each training window's loss weighted by the inverse-noise rule; six seeds averaged; figure 1b), the anchoring layer, the state rule and the anchoring-continuity layer; hourly errors score the delivered trajectory after that layer, energy, level and peak are read before it (readout rule A). Linear-context: the TiDE implementation of the release, whose forecast is a linear map of the load context.
