Prediction intervals on the nine populations (bold: the six release test populations). The ankyra-lite interval is the anchoring layer's interval readout around the delivered trajectory. Each line in b and c is one population; the dashed line is the nominal level; W4 is days 22–31. Computed after scoring, as a description. ankyra-lite 0.2.0: carrier recipe Rw (trained from scratch with early stopping on the 93-day validation set, then 8 more epochs with the validation span returned and each training window's loss weighted by the inverse-noise rule; six seeds averaged; figure 1b), the anchoring layer, the state rule and the origin-continuity layer; hourly errors score the delivered trajectory after that layer, energy, level and peak are read before it (readout rule A).
